TITLE: Some properties of coatings with epoxy and urethane resins

SOURCE: Lakokrasochnyye materialy i ikh primeneniye, no. 3, 1966, 37-38

TOPIC TAGS: ~~coatings~~, enamel coating, polyurethane^{resin}, ~~polyurethane~~^{specialized} coating, ~~resin~~, epoxy resin, elasticity, hardness

ABSTRACT: A comparative study has been made of some properties of enamel coatings made with E-33, E-41, and E-10 epoxy resins, against polyurethane coating with a UR-930 varnish base. It has been established that coatings made with E-10 resin were more resistant to dichloroethane. Enamel coatings with E-33 and E-41 resin base were found to have lower vapor permeability than polyurethane coatings. All coatings tested have shown a good metal-adhesion property. The enamel coating with an E-10 resin base was found to have a high degree of hardness but lower

Card 1/2

L 40320-66

ACC NR: AP6019448

elasticity as compared to other coatings. The E-33 resin-base coating has shown a higher degree of hardness combined with high elasticity. Tests with laboratory-type artificial-weather apparatus on naturally drying epoxy-urethane coatings have shown high resistance under test conditions. Orig. art. has: 2 figures and 4 tables. TITLE: Separation of Some Cations of Group III From Their Mixture
by Means of Ion-exchange Chromatography

PERIODICAL: Ukrainskiy khimicheskiy zhurnal, 1960, Vol. 26, No. 1,
pp. 113-116

TEXT: The authors studied the chromatographic separation of mixtures of Fe^{3+} and Ni^{2+} , Fe^{3+} and Mn^{2+} , Fe^{3+} and Co^{2+} on cation exchangers of Soviet origin: CEC-1 (SBS-1), ekspatit-1 KY-1 (KU-1), and KY-2 (KU-2). They used columns 20-25 cm high and 6-7 mm in diameter, filled with 5 g of ionless exchanger. The dissolved mixture was passed through at a rate of 1 drop per 2-3 sec. As SBS-1 and KU-1 reduce Fe^{3+} , 5-6 ml of 3% H_2O_2 was added to the solutions. On the other hand, SBS-1 and KU-1 resin is destroyed by repeated action of H_2O_2 . KU-2, however, is affected by ammonia. The absorption energy of cations of group III on SBS-1 was determined by a known method (Ref. 6); the following was found: $\text{Ni}^{2+} \leq \text{Co}^{2+} < \text{Mn}^{2+} < \text{Zn}^{2+}$

Card 1/2

Mixture by Means of Ion-exchange Chromatography B004/B054

$\langle \text{Fe}^{3+} \langle \text{Al}^{3+}$. Nickel was separated from iron by eluting Ni^{2+} with 1 N NaCl with addition of H_2O_2 . Fe^{3+} is not eluted, and can finally be displaced from the column by means of 2 N HCl. The following average analytical data are indicated: 92.9% of the Ni^{2+} portion were eluted from SBS-1; 96.8% from KU-1. KU-2 resin must be previously treated with NH_3 to permit an elution of Ni^{2+} (95.9%), with no Fe^{3+} passing into the filtrate. Separation of Mn^{2+} from Fe^{3+} is possible with the use of SBS-1 or KU-1 resin by elution with 1 N NaCl + H_2O_2 (97.5-99.5%). Separation is impossible with KU-2. Separation of Co^{2+} from Fe^{3+} was impossible with the resins mentioned. The accuracy of separation of Ni^{2+} and Mn^{2+} from Fe^{3+} is not affected by the $\text{Ni}^{2+} : \text{Fe}^{3+}$, and $\text{Mn}^{2+} : \text{Fe}^{3+}$, ratio in the range of from 1:1 to 1:50. Ye. B. Trostyanskaya is mentioned. There are 1 figure, 4 tables, and 6 references: 4 Soviet, 1 German, and 1 Polish.

TITLE: Possible use of gas ²⁵ lasers in high-precision ¹² measurements of distances

SOURCE: Geodeziya i kartografiya, no. 5, 1966, 9-15

TOPIC TAGS: ^{GAS LASER} optic range finder, ^{LASER APPLICATION} ~~laser range finder~~ SG-2M OPTIC RANGE FINDER,
 LG-55 ^{GAS LASER}

ABSTRACT: The authors describe experiments in which the light source of a precision optical range finder (SG-2M) was replaced by a small gas laser. The purpose of the experiment was to increase the accuracy of distance measurements with such a range finder and to permit its use under daylight conditions. Another advantage of the laser is that it delivers a beam of much narrower spectral width. The gas was a mixture of helium and neon operating at 6328 Å and delivering not less than 1 mW. The measurements were made of distances of the order of 3 km in sunlight and during twilight. In daylight, when the ordinary light source could not be used, the mean square measurement accuracy was ±2.4 mm, and in twilight, ±1.3 mm. Equipping the range finder with a laser approximately doubled the maximum distance measurable at night. The requirements that must be satisfied by the laser are specified, and it is found that the LG-55 developed by one of the MEK SSSR enterprises is the most suitable for this purpose.

Periodical : Byul. eksp. biol. i med. 8, 35-39, Aug 1955

Abstract : Author wanted to clarify the role of molecular concentrations as irritants when injected into the blood stream. To dogs under anesthesia he gave intravenous injections of comparatively harmless substances in solutions which equaled a 40% glucose solution: 16% glucacola, 12% urea, 76% saccharose. To the controls he gave 40% glucose. Sodium chloride in 5 to 25% solutions was also used. Author illustrates the results from his experiments on graphs and concludes that isotonic solutions do not depend on composition but on molecular concentration for their effect. 10 references, 8 USSR, 7 since 1940. TITLE:

A new Method for the Determination of the Order of the Interference Bands (Short Note) (Novyy metod opredeleniya poryadka interferentsionnykh polos (Kratkoye soobshcheniye))

PERIODICAL:

Vestnik Moskovskogo universiteta, Seriya matematiki, mekhanika, astronomii, fiziki, khimii, 1958, Nr 3, pp 161-164 (USSR)

ABSTRACT:

The author proposes a method which allows the determination of the interference band order only with the aid of the spectro-interferograms for arbitrary refraction coefficients. Four plane parallel quartz plates with the approximate thicknesses 1.000, 0.999, 0.990 and 0.900 mm are needed only. The methods of I.V. Obreimov, D.V. Chapur, A.A. Shishlovskiy, I.S. Gorban' are also shortly indicated. There are 5 Soviet references.

TITLE: Application of a Biprism for the Determination of the Dispersion of Transparent Materials. Short Communication (Primeneniye biprizmy dlya opredeleniya dispersii prozrachnykh veshchestv)

PERIODICAL: Vestnik Moskovskogo universiteta, Seriya
: 1958, Nr 4, pp 171-174

ABSTRACT: The author proposes a new interference method for the determination of refraction coefficients. With the aid of a biprism the light interference is generated from molten quartz; then a part of the interference beams is led through a plane parallel quartz plate, whereupon there appears a distortion of the spectro interferogram which is basic for the calculation of the coefficient. The usual deficiency of the method is the low light intensity; extraordinarily strong sources of light have to be used in order that the method can be applied successfully. An older method is that of I.V.Obreimov [Ref 1].

AUTHOR: Khomazyuk, V.G.

TITLE: The use of Fraunhofer diffraction for measuring the dispersion of light

PERIODICAL: Optika i spektroskopiya, v.12, no.4, 1962, 501-504

TEXT: Previous measurements of the dispersion of light by interferometric methods suffered from the disadvantage of low light intensity. The method described in this paper based on Fraunhofer diffraction has a simple mathematical basis and possesses maximum light intensity. The arrangement is as follows: Light from a slit S placed at the focus of a lens L produces a horizontal parallel beam of light which falls on a rectangular aperture in a vertical opaque screen, one half of which is covered by a plane parallel transparent plate. This plate introduces a path difference n expressed in wavelengths. The split beam is then focused on to a spectrograph slit Sp which is arranged at right angles to the slit S. In the experiment described the etalon plate is of quartz and it is immersed in distilled water. The refraction of the liquid can then be obtained with the Card 1/2

The use of Fraunhofer ...

S/051/62/012/004/005/015

aid of the formulae

$$(n_{liq} - n)d = N\lambda \quad \text{or} \quad n_{liq} = n + N\frac{\lambda}{d}$$

where n_{liq} is the refraction of the investigated liquid, n is the refraction of the etalon plate, d its thickness and N the order of the interference bands corresponding to the wavelength λ . The combined spectrum and interference patterns are recorded photographically and because of the large light intensity, exposures from 10 sec down to 1/10-th sec are used. There are 2 figures.

AUTHOR: Khomazyuk, V. G.

TITLE: Fresnel diffraction on the edge of a transparent semi-plate of finite thickness

PERIODICAL: Zhurnal tekhnicheskoy fiziki, v. 33, no. 4, 1963, 382-386

TEXT: The general case of Fresnel diffraction (near field) is studied on the edge of a fully transparent semi-plane of finite thickness. Illustrations and some denotations are given in the figure. Owing to the transparency of the plate the entire xy plane is assumed as opening. The light passing through the plate is not attenuated, only a phase

difference $\delta = \frac{\mu-1}{\lambda} d$ is observed where μ is the refractive index for the plate and λ is the wavelength of light. The studies are based on an approximate expression for the interference ψ of the light and an expression for the light intensity I of the diffraction pattern is derived $I = 4A^2 \left\{ \cos^2 \pi u + 2 [c^2(u) + s^2(u)] \sin^2 \pi u + [s(u) - c(u)] \sin^2 \pi u \right\}$.

Card 1/4

Fresnel diffraction on the ...

S/057/63/033/004/002/021
B187/B102

$A = \frac{1}{2} \exp(i\pi(\frac{t}{T} - \frac{r_0+r}{\lambda}))$ denotes a constant factor; T is the oscillation period; r_0 and r are the distances of the coordinate origin from the light source Q and the point of observation P ; $c(u)$ and $s(u)$ are the Fresnel integrals; u is the transformed variable

$\frac{\pi}{2} u^2 = \frac{\pi}{\lambda} \frac{r_0 + r}{r_0 r} \xi^2 \cos^2 \varphi$. The intensity in any point P of the

diffraction pattern is a function of the distances of the point corresponding to P on the Cornu spiral and their focal points with consideration of the phase shift $2\pi n$ caused by the plate. In the above definite shape it is determined by the phase difference n and the distance of the corresponding point of the spiral from the center of the geometrical shadow ($u = 0$) of the plate edge. For parallel beams

$A^2 = 1$ can be written without violating the generality. The formula then is in formal agreement with the results obtained by I. V. Obreimov (O prilozhenii Fresnelevoy difraktsii dlya fizicheskikh i tekhnicheskikh izmereniy, (On an application of the Fresnel diffraction in physical and

TITLE: Magnetoacoustic resonance in aluminum

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 42,
no. 1, 1962, 84-86

TEXT: Single crystals (10 mm in diameter and 2 mm thick) were grown from aluminum, for which $R_{4.2^{\circ}\text{K}}/R_{293^{\circ}\text{K}} = 6.7 \cdot 10^{-5}$. Using a pulse technique (A. A. Galkin, A. P. Korolyuk. PTE, 6, 199, 1960), the dependence of the absorption coefficient for longitudinal ultrasonic waves of 200 Mc/sec on the magnetic field strength was studied at field strengths of up to 4000 oe and at 4.2°K. An ultrasonic crystal attenuator was interposed in addition to the specimen between the receiving and the emitting piezo-electric crystal in order to separate the acoustic pulses accurately. The ultrasonic wave vector was parallel to the [111] direction of the single crystal with a maximum error of 5°. The magnetic field was always perpendicular to the wave vector. The transmission coefficient was

Card 1/3

33998

S/056/62/042/001/013/048
B104/B102

Magnetoacoustic resonance in aluminum

determined by a recorder as a function of the magnetic field strength. Two oscillation periods were detected in the inverse field:

$\nu \Delta H^{-1} \approx 6 \cdot 10^4 \text{ sec}^{-1} \text{ oe}^{-1}$ and $\nu \Delta H^{-1} \approx 32 \cdot 10^4 \text{ sec}^{-1} \text{ oe}^{-1}$. The anisotropy in the oscillation effects was examined, and three periods in an approximate ratio of 1:3:6 were established in a number of directions. The three different periods are attributed to the three electron groups with different effective masses, which have been detected by other scientists in testing aluminum with cyclotron resonance (D. N. Langenberg, T. W. Moore. Phys. Rev. Lett., 3, 137, 1959; E. Fawcett. Phys. Rev. Lett., 3, 139, 1959). In this way, the Fermi limiting velocities can be determined by a joint investigation of magnetoacoustic and cyclotron resonances. The results do not contradict W. A. Harrison's model of the Fermi surface of aluminum (Phys. Rev., 116, 555, 1959; 118, 1182, 1960; 118, 1190, 1960). A. F. Prikhod'ko, Corresponding Member AS UkrSSR, is thanked for having made work with liquid helium possible, E. I. Ponomarenko for having developed the high-sensitive receiver and for assistance in the measurements, and B. N. Aleksandrova for having prepared the high-purity aluminum. ✓ Electrochemical study of the catalyst and the mechanism of catalytic hydrogenation. II. Hydrogenation of crotonaldehyde and butyraldehyde by the adsorbed layer of hydrogen on platinum. G. P. Khomachenko and G. D. Yvchenko. *Vestnik Moskov. Univ.* 16, No. 6, Ser. Fiz.-Mat. Estestven. Nauk No. 6, 61-6 (1955); cf. *C.A.* 48, 3170g. The electrochem. methods of Shlygin (*C.A.* 46, 10074b; 49, 10102c, 12157d) were used to study the hydrogenation of $\text{C}_4\text{H}_7\text{CHO}$ (I) and $\text{MeCH}_2\text{CH}_2\text{CHO}$ (II) on platinized Pt in N. HCl and $\text{N. H}_2\text{SO}_4$. The fractions of the adsorbed H that were active and less active were for I in HCl , 31 and 20%; for I in H_2SO_4 , 20 and 23%; for II in HCl , 43 and 30%; and for II in H_2SO_4 , 31 and 26%, resp. The drop in pos. potential when the degassed electrode adsorbed I and II showed that I was more rapidly adsorbed and the dipoles were oriented with the neg. ends to the electrode. The increased H reactivity in HCl soln. was attributed to the increase in the binding energy of the adsorbed H from H_2SO_4 in comparison with that from HCl . These energies were obtained from the charging curves. J. H. Scott

KHOMCHENKO, G. P.

✓ The adsorption properties of the electrode-catalyst in progressive poisoning. G. P. Khomchenko. *Uchenye Zapiski, Moskva, Gosudarst. Univ. im. M. V. Lomonosova* No. 174, 319-25 (1955).—Adsorption of acid from 1N NaCl + 0.01N HCl on platinized Pt was studied. The adsorption of an unpoisoned electrode is proportional to the true surface. An electrode with an apparent area of 0.9 cm² and a true area of 0.16,860 sq. cm. adsorbs about 16 micromoles of acid at a potential of +0.85 v. (relative to the H electrode) and -0.2 micromoles at 0 v. On progressive poisoning of the electrode with As₂O₃ the quantity of adsorbed acid at pos. potentials decreased and may even become neg. at a high degree of poisoning (equiv. to 20% of the true surface). For adsorption of As₂O₃ sufficient to cover 12.5% or more of the true surface, adsorption of acid attains a max. with increasing potential and then declines to zero or neg. values. As₂O₃ poisoning affects adsorption by destruction of the double layer that exists at the interface between the electrolyte and unpoisoned electrode. G. P. Khomchenko

(Poison influence of mercury on adsorptive properties of the electrode catalyst) G. P. Rhomchenko, *Vestnik Mosk. Univ., Ser. Mat., Mekh., Astron., Fiz. i Khim.* 11, No 2, 176-8 (1958). --HgCl₂, reduced with H₂ to Hg on the electrode, was used as poison of a platinized Pt electrode in N NaCl + 0.01N HCl. Measured was the amt. of adsorbed acid as function of potential, related to the normal H electrode. It was found that Hg, progressively poisoning the Pt electrode, shifts the zero potential to the cathode side. Contrary to the action of As, Hg increases the adsorptive capacity of the electrode with the potential movement to the anode. It is assumed that the phenomenon is caused by a polar bond between the atoms of the poison and of the electrode.

Change of electrochemical properties of the catalytic electrode with a progressive poisoning. G. P. Khomchenko. *Vestnik Moskov. Univ., Ser. Mat., Mekh., Astron., Fiz. i Khim.* 11, No. 2, 178-83 (1956).—The electrochem. behavior of the platinized Pt electrode was investigated as a function of its progressive poisoning with As and with Hg in a N NaCl + 0.01N HCl soln. A marked effect occurs when 2-2.5% of the electrode surface is covered with As or Hg. It consists of an increased potential of the H_2 evolution. Oxidation occurs earlier on a poisoned electrode. The progressive poisoning with As causes a considerable decrease of the electrode capacity but at the same time a strong increase of the double-layer capacity. The Hg poisoning causes a decrease of both the electrode capacity and the double-layer capacity. The poisoning effect is smaller for electrolyte adsorption than for H adsorption. With the desorption of the poison, the adsorptive property of the electrode for the electrolyte and for H are reestablished. E. Ryslikewitch.

An electrochemical study of catalysts and of the mechanism of catalytic hydrogenation. III. Hydrogenation of crotonaldehyde and butyraldehyde in the adsorption layer of hydrogen on palladium. G. P. Khomchenko and G. D. Vovchenko (State Univ., Moscow). *Vestnik Mosk. Univ. Ser. Mat., Estn., Astron., Fiz., Khim.* No. 3, 159-64 (1957); cf. C.A. 50, 9177g. — In contrast to Pt, a Pd catalyst is specific in that PrCHO is not hydrogenated in the adsorption layer of H, whereas crotonaldehyde (I) is hydrogenated as with Pt. On the catalyst 70% of the H was active, 0% slightly active, and 18% inactive; this revealed its heterodynamic catalytic nature. The adsorption capacity of PrCHO, I, and BuOH on the surface of a Pd electrode catalyst was detd. The curves of potential vs. time showed that these compds. had a dipole moment, and by their orientation on the catalyst surface when adsorbed I shifted the potential to the anode side, PrCHO and BuOH to the cathode first, then to the anode side. The possible electron reactions between the compds. and the catalyst are discussed.

AUTHOR: Khomchenko, G.P.

TITLE: On the Relation of the Adsorption and Capacity Properties of a Platinum Electrode With Catalytic Effect (O sootnoshenii adsorbtsionnykh i yemkostnykh svoystv platinovogo elektroda-katalizatora)

PERIODICAL: Vestnik Moskovskogo universiteta, Seriya matematiki, mekhaniki, astronomii, fiziki, khimii, 1958, Nr 5, pp 123 - 128 (USSR)

ABSTRACT: In preceding papers of the author [Ref 1 - 3] the adsorption and capacity properties of a catalytically effecting electrode of platinized platinum were investigated. These properties are now compared with each other, whereby valuable indications to the mechanism of the potential formation on the boundary electrode-solution are obtained. The total potential jump could be decomposed into components and the influence of the double ionic layer as well as of the adsorbed gas on the potential formation could be cleared up. Poisoned as well as non-poisoned electrodes were investigated. Among others it was stated that for progressive poisoning arsenic diminishes the influence of the double ionic layer and increases the influence of the dipole atoms of the gas layers on the potential formation. Great arsenic

Card 1/2

Properties of a Platinum Electrode With Catalytic Effect

quantities facilitate the sedimentation of the oxygen which in this case causes a change in charge of the double layer. The covering of great quantities of mercury on the electrode has nearly an inverse effect. The comparison carried out by the author has been undertaken for the first time by A.N. Frumkin and A.I. Shlygin [Ref 4].

TITLE: The Eighth Mendeleev Congress on General and Applied Chemistry

PERIODICAL: Vestnik Moskovskogo universiteta. Seriya matematiki, mekhaniki, astronomii, fiziki, khimii, 1959, Nr 4, pp 225-231 (USSR)

ABSTRACT: This congress took place in Moscow from March 16 - 23, 1959. The author gives a short survey of preceding Mendeleev congresses. At the eighth congress a total of 1500 lectures was delivered, among them 11 in the plenary sessions: Chairman of the Gosudarstvennyy Komitet Soveta Ministrov SSSR po khimii (State Committee of the Council of Ministers of the USSR for Chemistry), V.S. Fedorov: "Problems of Scientific and Technical Progress in the Chemical Industry"; Academician V.A. Kargin: "Fundamental Problems of the Chemistry of Polymers"; Academician A.N. Nesmeyanov: "The Periodic System of D.I. Mendeleev and Organic Chemistry"; Academician N.N. Semenov: "Fundamental Problems of Chemical Kinetics"; Academician V.I. Spitsyn: "The Present Stage of the Periodic Law of D.I. Mendeleev"; Academician A.P. Vinogradov: "Fundamental Problems of Radiochemistry"; Academician V.A. Engel'gardt: "Fundamental Problems of Biochemistry"; Professor A.V. Sokolov: "Chemical Problems of the Agriculture of the USSR"; V.B. Nikolayev: "The Most Important Tasks of Chemical Apparatus- and Machine Building"; Professor Ya.K.

B004/B007

Syrkin: "Fundamental Problems of the Theory of Chemical Bonds";
Academician A.P. Aleksandrov: "The Chemical Aspects of Atomic
Energy". At this congress, 17 sections, 19 subsections, the symposium
on higher chemical and technological training, and the commission
for nomenclature were in operation. In the Section of Inorganic
Chemistry the lecture delivered by Academician V.I. Spitsyn on
tasks of inorganic chemistry is mentioned in connection with the
decisions taken by the 21st Congress of the CPSU. In this section
there worked the subsections for physical-chemical analysis, for
the chemistry of complex compounds, for problems of general chemistry
and of technology. In the Section for Organic Chemistry and
Technology, G.V. Uvarov, Deputy Chairman of the State Committee
of the Council of Ministers of the USSR for Chemistry, spoke about
the perspectives of the development of the industry of organic
synthesis in the USSR during the period of from 1959 to 1965.
Corresponding Member AS USSR, Holder of the Lenin Prize G.A.
Razuvaev, dealt with the reaction of radical exchange. In this
section 220 lectures were delivered. Section of Analytical Chemistry:
Mention is made of the lecture delivered by Corresponding Member,
AS USSR, I.P. Alimarin on the present problems of analytical chemistry.
Section of Physical Chemistry: 100 lectures were delivered. Mention is

Card 2/4

made of Academicians A.N. Terenin, M.M. Dubinin, A.A. Balandin, and Corresponding Member AS USSR Ya.I. Gerasimov. The subsections for the structure of matter, for the kinetics of chemical reactions, for catalysis, and for adsorption were in operation. The Section for Colloid Chemistry dealt with topical problems belonging to this field. In the Section for the Chemistry and Technology of Polymers, more than 80 lectures were delivered. In the Section for the Chemistry of Natural Compounds and of Biochemistry, about 100 lectures were delivered. Apart from joint meetings, also such of the subsection for biochemistry and the chemistry of natural compounds were held. Academician M.M. Shemyakin spoke about the development of the chemistry of natural compounds, Professor N.A. Preobrazhenskiy about Synthetic Research in the Field of Alkaloids. Academician A.I. Oparin spoke about fermentative processes in co-acervate drops. The Section of Agronomic Chemistry, Fertilizers, Insecticides and Fungicides held 4 meetings. Academician S.I. Vol'fkovich spoke about highly concentrated mixed fertilizers, Academician B.A. Arbuzov on phosphor-organic insecticides. In the Section for the Chemistry and Technology of Fuels, 60 lectures were delivered. Moreover, the following sections are mentioned: Chemistry and Technology of Food; Chemistry and Technology of Silicates (60

lectures); Radiochemistry and Chemistry of Isotopes; Theoretical and Applied Electrochemistry; Economy, Planning, and Organization of Chemical Plants; Fundamental Principles and Apparatus of Chemical Technology; Questions Relating to the History of Chemistry and Chemical Technology. In the Section Chemistry of Metals and Alloys, 50 lectures were held. Corresponding Member AS USSR, N.V. Ageyev, gave a survey of the investigation of metal systems in the USSR. In the final session of the Congress, Professor Dimitr Ivanov (Bulgaria) expressed the gratitude of the foreign scientists. Suggestions were submitted to the Presidium of the management of the Vsesoyuznoye khimicheskoye obshchestvo im. D.I. Mendeleeva (All-Union Chemical Society imeni D.I. Mendeleev) for the decision of problems relating to the convening of the next Congress, the establishment of a House of Chemistry in Moscow, the increase in the publication figures of chemical literature, new periodicals, and the establishment of new Institutes and the introduction of special fields.

TITLE: The Electrochemical Investigation of Catalysts and the Mechanism of Catalytic Hydrogenation. IV. Hydrogenation and Adsorption of Allyl Benzene on a Platinum Catalyst

PERIODICAL: Vestnik Moskovskogo universiteta. Seriya matematiki, mekhaniki, astronomii, fiziki, khimii, 1959, No. 6, pp 186 - 193

TEXT: The authors used the method described in Refs. 1 and 2. On the electrode 0.2g of finely disperse platinum is deposited from a 2% solution of platinum chloride. The actual platinum surface was 15,000 cm², the adsorption capacity of hydrogen was $2.4 \cdot 10^{-5}$ gram-atoms, with 74% of the surface being covered by H₂. The electrolyte used was 0.1 N H₂SO₄. Fig. 1 shows the reaction with 0.5 mole/l of allyl benzene. The potential shift is only low. Hence, only a fraction of the H₂ adsorbed on the electrode enters into reaction. If N₂ passes through the solution, the hydrogenation is accelerated due to more thorough mixing. After the occurrence of the steady potential, the hydrogen which did not enter into

B004/B002

reaction by anode polarization was found to be 33.3% (Fig. 2). Only hydrogen with a low bond energy (up to 0.1 v) was reactive. At present, the role of the bond energy of hydrogen during hydrogenation is being investigated by the author by examining the influence of catalyst poisons. From the data of Figs. 1, 2 the kinetics of the distance between H_2 and catalyst during hydrogenation was determined. As shown by Fig. 3, hydrogen is irregularly linked with the electrode: 12.5% is in an active state and reacts quickly, 54.2% is less active, and 33.3% is inactive. The number of active centers of the catalyst was found to be $0.9 \cdot 10^{18}$. As to its reactivity, allyl benzene is therefore inferior to crotonaldehyde and butyric aldehyde (Ref. 1). The investigation of the electrolytic reduction of allyl benzene yielded a low reaction rate below the potential of the hydrogen electrode (Fig. 4). Only within the range of overvoltage it is more intensive. Fig. 5 shows the potential change in the adsorption of allyl benzene of different concentrations on the degasified catalyst. A comparison of electrolytic hydrogenation of the allyl benzene adsorbed on the catalyst (Fig. 6) (for results see Figs. 1, 2) yields the kinetic curve of its adsorption, and of its hydrogenation rate (Fig. 7).

IV. Hydrogenation and Adsorption of Allyl Benzene
on a Platinum Catalyst

S/055/59/000/06/23/027
B004/B002

Adsorption is much faster than hydrogenation and therefore cannot have a limiting effect. From the potential shift towards the anode it is concluded that allyl benzene is deposited at the positive ends of its dipole. The dipole moment μ was $0.1 \cdot 10^{-18}$ absolute electrostatic units. There are 7 figures and 3 Soviet references.

found to be $1.2 \cdot 10^{-18}$ absolute electrostatic units. The reduction course given in Fig. 3, curve II, shows that the adsorption and reduction rates differ but little, so that the former may have a limiting effect. Fig. 4 shows the reduction of butenediol by means of adsorbed hydrogen, and its electrolytic reduction. In both cases the H adsorbed enters into reaction. Fig. 4 shows that only 55% of the H adsorbed is strongly active (has a low binding potential), whereas 26% are less active and 19% inactive. The influence of catalyst poisons (As, Hg) on the course of reduction will be published later on. There are 4 figures and 5 Soviet references.

TITLE: Konstantin Grigor'yevich Khomyakov (on his 70th birthday)
PERIODICAL: Zhurnal fizicheskoy khimii, v. 35, no. 1, 1961, 228-229

TEXT: This is an article written on the occasion of the 70th birthday of K. G. Khomyakov, Professor, Doctor of Chemistry, on January 1, 1961. Khomyakov's scientific activity has always been connected with the Moskovskiy gosudarstvennyy universitet (Moscow State University). In 1915, when still a student, he collaborated with V. V. Razumovskiy on problems of defense. In the following year he worked as a chemist at the factory, in which the results of those studies were put into practice. After the revolution, the terrain of that factory was used for the construction of the first Scientific Research Institute of Applied Chemistry, at whose central laboratory Khomyakov worked for 12 years. In 1917, Khomyakov graduated from the khimicheskoye otdeleniye fiziko-matematicheskogo fakul'teta MGU (Chemical Department of the Division of Physics and Mathematics of Moscow State University), and, on a suggestion by

Professor I. A. Kablukov remained at the University, where he worked at the thermokhimicheskaya laboratoriya im. V. F. Luginina (Thermochemical Laboratory imeni V. F. Luginin). In 1919, on Professor M. M. Popov's advice, he started with lectures of chemistry at the Rabochiy fakul'tet (Workers' Division) of the Moscow State University. As of 1930, he became concerned with industrial problems, e.g., when commissioned by the Institut udobreniy (Institute of Fertilizers) in collaboration with M. M. Popov, P. K. Shirokikh, N. N. Fedos'yev, and S. F. Yavorskaya on phosphates, and also on the catalytic synthesis of Synthol. He was awarded the D. I. Mendeleev Prize for this activity. In 1934, Professor Khomyakov began with the study of the kinetics of dissociation of carbonates and the dehydration of crystal hydrates. This study was the basis on which he built his dissertation for a doctor's degree "Study of the transformation of solid phases under formation of a new solid phase and of gas". As from 1943, Khomyakov has been supervising the kafedra obshchey khimii (Department of General Chemistry) of the Chemical Division of Moscow State University. Under his guidance, studies were conducted (using calorimetric methods of continuous adiabatic electric heating) on transformations in metal and salt systems in the solid state (with V. A. Kholler, M. Ye. Levina,

V. A. Troshkina), on synthesis of zinc phosphide (with N. V. Karvyalis), on the kinetics of the decomposition of molybdenum and tungsten peroxides (with G. V. Kosmodem'yanskaya), as well as (with I. A. Zaydenman) on the primary phase of the formation of Synthol from CO and H₂; furthermore, studies of the magnetic alloys Fe-Ni-Al and Fe-Co-Al (with V. A. Troshkina and Yu. D. Tret'yakov). Starting in 1956, Khomyakov has been conducting studies on the chemistry and the physics of ferrites. Mention is made of the study of multicomponent systems of salts of the schoenite type (with M. I. Ozerova and Yu. D. Tret'yakov), the specific heat of ferrites (with L. A. Reznitskiy), the valence states of cations in ferrites (with V. A. Kholler and A. I. Pavlova-Verevkin). Khomyakov is at present holding lectures on physicochemical analyses. The first volume of his book "Lektsii po obshchey khimii" (Lectures on General Chemistry) was published in 1957, and the second volume has now gone to the press. Khomyakov has been decorated with the Lenin Order. There is 1 figure.

TITLE: The effect of the structure of organic compounds on their reduction and adsorption

PERIODICAL: Moscow. Universitet. Vestnik. Seriya II. Khimiya, no. 1, 1963, 27-31

TEXT: The reduction and adsorption properties of butynediol-1,4 (I), tetramethylbutynediol-1,4 (II) and 1,4-dimethyl-1,4-diethylbutynediol (III) were studied in 0.1N H_2SO_4 , using a platinized Pt electrode which also served as a catalyst (true surface 17000 cm^2). 83% of the electrode surface was covered with atomic hydrogen. It was found that the rates of catalytic reduction of I, II and III in the adsorption layer of hydrogen and of electroreduction decreased in the order $I > II > III$. The rates of electroreduction were very low but increased rapidly as the electrode potential became less positive (i.e. with a decrease in the adsorption potential

Card 1/2
